

# Virtual Crates

A Visual Walkthrough

# Description/User Story

Virtual Crates is a mock social networking and logging app designed to allow record collectors to share posts about the love of the hunt. It uses a create, read, update, delete model and uses a NodeJS/MongoDB/Express backend to allow for most of the CRUD features to be handled by the back end and post permanence..

My motivation for this project came from my love of records and my annoyance at buying duplicate copies of titles. I also love the thrill of the find, especially in bargain bins, and wanted to share this joy with others with similar feelings.

# Planning/Functionality

- Unique User login/logout and sign up.
- Once a user has created an account, they have access to the CRUD functions of the app. If they are not a registered user they can still see post lists, but have little access to content. Only registered users can access the editing/deleting capabilities, and only on their own posts. .
